Washington, D.C. 20426-0001

**Subject: Yuba River Development Project  
FERC Project No. 2246-065  
Amendment to Technical Memorandum 3-11, Entrainment**

Dear Secretary Bose:

This letter serves as an amendment to Technical Memorandum 3-11, *Entrainment*, which was filed on April 28, 2014 with the Federal Energy Regulatory Commission (FERC or Commission) by the Yuba County Water Agency (YCWA) as part of its Application for New License – Major Project Existing Dam for YCWA's Yuba River Development Project, FERC Project Number 2246 (Project).

#### **BACKGROUND**

In its January 30, 2014 comments on YCWA's December 2, 2013 Updated Study Report, the California Department of Fish and Wildlife (Cal Fish and Wildlife) requested that FERC direct YCWA to remove from Technical Memorandum 3-11 four periods from consideration when calculating entrainment rates because Cal Fish and Wildlife "... believes that periods of reduced detection efficiency and marker tag malfunction resulting in radio frequency emission cannot be counted as operational array periods due to uncertainties of antenna effectiveness." (p. 2 of Cal Fish and Wildlife's January 30, 2014 letter). At the Lohman Ridge Diversion Tunnel, the specific periods that Cal Fish and Wildlife suggested be excluded were:

- December 5 through 20, 2012 – "Given the uncertainty associated with this sample period, the Department request that YCWA remove these days from the entrainment calculations at the Lohman Ridge Diversion Tunnel and recalculate the entrainment rate based on the number of days when the array was functioning properly." (p. 3 of Cal Fish and Wildlife's January 30, 2014 letter).

At the Camptonville Diversion Tunnel, the specific periods that Cal Fish and Wildlife suggested be excluded were:

- December 28, 2012 through January 8, 2013 – "Due to the uncertainty of this ten-day period, the Department requests that YCWA remove this time period from the

*entrainment calculations at the Camptonville Diversion Tunnel and recalculate the entrainment rate based on the number of days when the array was known to be functioning properly.”* (p. 3 of Cal Fish and Wildlife’s January 30, 2014 letter).

- All time periods with detection efficiencies of less than 80 percent - “*Due to these reduced detection efficiencies (range of 20% to 80%) for 12 mm tags, the Department requests that all time periods with detection efficiencies of less than 80% for 12 mm tags in which water levels were above the bottom array at the Camptonville Diversion Tunnel array be excluded for the purposes of calculating entrainment.*” (p. 3 of Cal Fish and Wildlife’s January 30, 2014 letter).
- January 16, 2013 through February 3, 2013 – “*The Department recommends this period of sampling error be omitted from the entrainment analysis as well*” because the marker tag malfunctioned, which caused it to emit a signal approximately every second for this period and no fish were detected (p. 4 of Cal Fish and Wildlife’s January 30, 2014 letter).

Similarly, in its January 30, 2014 comments on YCWA’s Updated Study Report, the United States Department of Agriculture, Forest Service (Forest Service) stated “*It is apparent from the Tech Memo 3.11 (see Section 3.1.1) that there were several periods when the antenna arrays were off-line (removed to clear debris) or not functioning at appropriate efficiency rates. The potential effects of these functionality gaps should be discussed in the Tech Memo in relation to the calculated entrainment rates.*” (p. 2 of Attachment 1 to Forest Service’s January 30, 2014 letter).

In response to these requests, at pages B-4 and B-5 of Appendix B in its November 13, 2014 *Determination on Requests for Modifications to the Yuba River Development Project Study Plan*, FERC states:

As previously addressed in our interim study plan determination issued on March 29, 2013, a review of Technical Memo 3.11 indicates that the periods of time when the [passive integrated transponder] PIT-tag antenna arrays were offline or not functioning efficiently were limited in nature. Calculating the entrainment rates that accounts for times when PIT-tag detection was impaired or non-existent would provide a more accurate entrainment rate. As a result, we recommend that YCWA re-calculate the reported fish entrainment rates to account for times when PIT-tag detection was impaired or non-existent.

Any resulting changes to Technical Memo 3.11 should also be reflected in an amendment to the final License Application filed on April 28, 2014.

As background, the PIT-tag antenna array monitoring systems commenced operation at the

Lohman Ridge and Camptonville diversion tunnels at 10:00 AM on October 22, 2012 and ceased operations at 8:00 AM on November 7, 2013, for a total of 9,064 hours (hrs) at each tunnel. This is referred to as the “Total Study Period” in this letter.

Each antenna array was composed of three, stacked (i.e., bottom, middle and top) panels, and the arrays were deployed in the tunnels about 10 to 15 feet (ft) downstream of the trash rack at the tunnel intake. The Camptonville Diversion Tunnel antenna array was 12.6 ft tall by 14.5 ft wide, for a total area of 183 square feet. The bottom and middle panels were each 4.1 feet (ft) tall, and the top panel was 4.4 ft tall. YCWA calculated that a flow through the tunnel of 346 cubic feet per second (cfs) wetted the entire bottom panel, a flow of 692 cfs wetted both the bottom and middle panels, and the full tunnel flow of 1,100 cfs wetted all three panels (i.e., all water in the tunnel passed through the array).

The Lohman Ridge Diversion Tunnel antenna array was 10.5 ft tall by 12 ft wide, for a total area of 126 square feet. The bottom and middle panels were each 3.5 ft tall, and the top panel was 3.6 ft tall. A flow through the tunnel of 310 cfs wetted the entire bottom panel, a flow of 546 cfs wetted both the bottom and middle panels, and the full tunnel flow of 860 cfs would wet all three panels (i.e., all water in the tunnel passed through the array).

Figure 1 shows the Camptonville Diversion Tunnel antenna array during fabrication.

**Figure1. Lohman Ridge Diversion Tunnel PIT-tag antenna array during fabrication.**

All information referenced in this letter is in the relicensing record as part of YCWA's Application for New License (FLA) except for: 1) antenna amperage records for the Lohman Ridge and Camptonville diversion tunnel antenna arrays, which are included in Attachment 1 of this letter; and 2) stage-flow relationships for Lohman Ridge and Camptonville diversion tunnel, and discharge for the study period, which are included in Attachment 2.

## **YCWA'S RE-CALCULATION OF ENTRAINMENT RATES**

### **1.0                  Periods When PIT-Tag Antenna Arrays Were Non-Existent or Impaired**

During the Total Study Period, the PIT-tag antenna array systems would be considered "non-existent" under two conditions:

- water was not being diverted through the tunnel; and
- the PIT-tag antenna array was removed from the tunnel for maintenance.

The PIT-tag antenna array would be "impaired" under two conditions:

- water and the PIT-tag antenna array were in the tunnel, but the antenna array was not functioning as indicated by failed power supplies, malfunctioning of the data loggers, or a lack of marker tag detections; and
- water and the PIT-tag antenna array were in the tunnel, but the PIT-tag antenna array detection was impaired as indicated by an efficiency test of less than 80 percent.

Each of these conditions is described below.

#### **1.1                  PIT-Tag Detections by Antenna Array "Non-Existent"**

##### **1.1.1              Water Not Diverted Through Tunnel**

During the 9,064-hour Total Study Period, water was not diverted through the Lohman Ridge Diversion Tunnel for 2,881 hrs and water was not diverted through the Camptonville Diversion Tunnel for 3,160 hrs because of insufficient flows in the river to make diversions (Table 1). During this time, the antenna arrays were in the tunnels but no flow or fish were in the tunnels. There were no PIT-tag detections by the antenna arrays during these periods.

**Table 1. Period and duration during the Total Study Period when PIT-tag detections by the Lohman Ridge Diversion Tunnel or the Camptonville Diversion Tunnel PIT-tag antenna array were non-existent because water was not diverted through the tunnel.**

### 1.1.2 Antenna Array Removed for Maintenance During Diversions

Periodic maintenance of the diversion tunnels and antenna arrays was necessary during the Total Study Period. This required that the antenna array be removed from the tunnel during the diversion of flows. These maintenance periods totaled 25.5 hrs at the Lohman Ridge Diversion Tunnel and 75.2 hrs at the Camptonville Diversion Tunnel (Table 2). During these hrs, flows passed through the tunnel, but PIT-tag detection by the antenna array was non-existent because the array was not deployed in the tunnel.

**Table 2. Period, duration and tunnel flows during the Total Study Period when the PIT-tag detections by the Lohman Ridge Diversion Tunnel or the Camptonville Diversion Tunnel PIT-tag antenna array were non-existent because the antenna array was removed from the tunnel for tunnel or array maintenance.**

Average tunnel flow during the maintenance period. Mean daily tunnel flow on September 2 and September 3, 2013 were 16.6 cfs and 40.1 cfs, respectively.

## 1.2 PIT-Tag Detections by Antenna Array “Impaired”

### 1.2.1 Antenna Array in Tunnel, But Not Functioning Properly

There were periods at each location, when flows occurred in the tunnel and the antenna array was deployed in the tunnel, but the array was not operating properly. This was indicated by several factors, such as power failure to the array, a malfunctioning PIT-tag reader<sup>1</sup>, or a lack of “marker” PIT-tag detections.<sup>2</sup> One, or a combination of these conditions, occurred for 744 hrs in the Lohman Ridge Diversion Tunnel antenna array and for 456 hrs in the Camptonville Diversion Tunnel antenna array (Table 3). During these periods, PIT-tag detection by the antenna array was considered impaired because the array may not have been properly functioning.

**Table 3. Period, duration and tunnel flows during the Total Study Period when the PIT-tag detections by the Lohman Ridge Diversion Tunnel or the Camptonville Diversion Tunnel PIT-tag antenna array was non-existent because of power failure to the array, software bugs in the antenna array computer system, malfunctioning PIT-tag readers or lack of “marker PIT-tag detections.**

<b>Total</b>	<b>504</b>	<b>219</b>		<b>Total</b>	<b>456</b>	<b>275</b>	

<sup>1</sup> This period met YCWA criterion for “Antenna Array in Tunnel, But Not Functioning Properly,” but was not removed at the request of the Cal Fish and Wildlife and the Forest Service. The period is noted in this table for informational purposes only, and is not included in the total of 504 hrs. This period overlapped with a period of impaired function for the Lohman Ridge Diversion Tunnel Antenna Array from December 5 through 27, 2012. This resulted in changes to the accounting of that period and is detailed in Section 1.2.2.1 below.

However, at the request of the Forest Service and Cal Fish and Wildlife at an April 14, 2014 meeting, YCWA reinstated for the Lohman Ridge Diversion Tunnel the 240-hr period from December 2 through 11, 2012. During this period, the marker tag was removed from the antenna through an unknown mechanism (i.e., YCWA assumed that something, such as debris, damaged the marker). However, seven PIT-tagged fish<sup>3</sup> were

<sup>1</sup> The PIT-tag reader was capable of reporting error codes to indicate when it was not functioning properly.

<sup>2</sup> To determine that the antenna array was operating, YCWA deployed for the duration of the study a single marker PIT tag near the center of the antenna array in each tunnel. The marker tag was set to “reveal” itself to the antenna every 3 minutes to confirm that the antenna array was operating. Refer to Technical Memorandum 3-11, *Entrainment*, Section 2.2.1, *Installation and Calibration of Antennas*, for a discussion of the methods used for the marker tags, and to Section 3.1.1.2, *Marker Tag Detection*, for the results of the marker tag detections.

<sup>3</sup> YCWA collected and implanted either a 23-mm (i.e., generally in fish greater than 150 millimeters [mm] long) or 12-mm PIT-tag (i.e., generally in fish between 80 and 149 mm long) in fish in the diversion dam impoundments and in the stream upstream of the impoundments. Each PIT-tag had a unique, 16-digit serial number programmed on the PIT-tag. When a tagged fish passed near the antenna array, if the array was properly functioning, the antenna array detected the PIT-tag in the fish, and recorded on the antenna array data logger the tag’s unique serial number. This was considered a single detection. In many cases, PIT-tagged fish were detected multiple times (more than 30 minutes apart) in one day, or over the course of months. When this occurred, only the last detection of a fish was used to determine a detected fish. Refer to Technical Memorandum 3-11, *Entrainment*, Section 2.2.1, *Monitor Diversion Tunnel Entrainment*, for more discussion regarding this.

detected by the array during this period. Given that fish detections were measured during this period, the Forest Service and Cal Fish and Wildlife requested YCWA retain the period in the “properly functioning” category. Reinstating this period results in a total of 504 hrs in the Lohman Ridge Diversion Tunnel antenna array removed because the antenna array was in the tunnel, but not operating properly (Table 3).

### 1.2.2 Antenna Array in Tunnel, But Efficiency Less Than 80 Percent

The FERC-approved study plan targeted a PIT tag detection efficiency of 80 percent or greater for each size of PIT-tag used in the study (i.e., 12 mm and 23 mm) as determined by area of the array (e.g., if 85% of the array by area detected test PIT-tags during an efficiency test, the efficiency was considered 85%).<sup>4</sup> Tests were run for both sized tags because the 23-mm tags emit a stronger signal than the 12-mm tags, resulting in a detection radius of approximately 2.5 ft for the 23-mm tags and approximately 1.0-ft for the 12-mm tags (i.e., the 23-mm tags were much more easily detected than the 12-mm tags). However, in some tests, if the 12-mm tag efficiency was at 100 percent for a panel, it was assumed the 23-mm tag efficiency was also 100 percent.

Testing for each sized tag was conducted under four conditions:

- By hand outside tunnel. When the antenna array was in the dry (i.e., removed from the tunnel for tunnel or antenna array maintenance, the array was divided into 1-ft by 1-ft grids and a test tag was passed by hand through each grid.
- By hand in tunnel. When the array could be accessed by foot in the tunnel (e.g., when flow in the tunnel was 80 cfs or less, the array was divided into 1-ft by 1-ft grids and a test tag was passed by hand through each grid.
- Lowered into array. When the array could not be safely accessed by foot in the tunnel, test tags were lowered from an opening above the array.
- Floated into array. When the array could not be safely accessed by foot in the tunnel, test tags were floated on the water surface into the tunnel to contact the array. This method did not test the portions of the array not submerged at the time of the test.

During periods when efficiency tests were not conducted, individual antenna array amperages indicated changes in monitor detection efficiency and performance. Individual antenna array amperages were positively correlated with individual antenna detection efficiency and, thus, were a useful proxy to evaluate weekly antenna performance.<sup>5</sup> Minimum and maximum amperage was recorded for each panel each time the array was

<sup>4</sup> During the Total Study Period, YCWA conducted 38 efficiency tests (i.e., 19 tests for the 23-mm tags and 19 tests for the 12-mm tags) of the Lohman Ridge Diversion Tunnel antenna array and the 34 efficiency tests (i.e., 17 tests for the 23-mm tags and 17 tests for the 12-mm tags) of the Camptonville Diversion Tunnel antenna array. Refer to Technical Memorandum 3-11, *Entrainment*, Section 2.2.1, *Installation and Calibration of Antennas*, for a discussion of the methods used for efficiency testing.

<sup>5</sup> Amperage for each antenna varied by panel and location. Baseline values were established for each antenna at the onset of the study and re-tuning was conducted based on the professional judgment of field staff and the results of efficiency testing.

visited to download data. When either amperages or detection efficiencies decreased, the antenna arrays were re-tuned.<sup>6</sup>

Table 4 shows the methods used and results of efficiency tests for each panel and for the overall array in each tunnel. Overall efficiency tests that were less than 80 percent efficiency are shaded in yellow in the table.

**Table 4. Date, method and results of PIT-tag antenna array efficiency tests by tag size in the Lohman Ridge Diversion Tunnel and Camptownville Diversion Tunnel.**

---

<sup>6</sup> Each individual antenna was tuned separately. As a first step, inductance was measured to determine the approximate capacitance setting. On the tuning board for each antenna, specific jumper settings (i.e., used to change the capacitor settings) were changed according to the specific inductance for that antenna. Once the jumper setting was determined, the tuner was fine-tuned using a fine-scale adjustment on the circuit board of the tuner box. After each antenna was tuned using this procedure, the antenna was tested with both size PIT tags to estimate the detection efficiency. Also, since the tuning adjustment of one antenna could affect the performance, through resonance, of the other antennas, the performance (i.e., detection efficiency) of each individual antenna was tested at the same time. Finally, when all three antennae were determined to be tuned correctly, the entire array was tested for performance. If at this point, the entire antenna array was not detecting tags at or above 80 percent efficiency, the entire procedure was repeated. This procedure was time consuming and required direct access to the frame of the antenna array.

<sup>1</sup> The reader on the top panel of the Lohman Ridge Diversion Tunnel failed on December 5, 2012. The efficiency test value on December 11 reflects the condition of the antenna after a new reader was installed. The replacement tag reader only functioned for a few hours, resulting in an effective period of impairment from December 5 through 27, 2012.

<sup>2</sup> ND means no data.

<sup>3</sup> NI means not inundated (i.e., not wetted during the test).

<sup>4</sup> Percent for the portion of the array that was assessed using the indicated method (if a panel was not wetted, it was not used to calculate overall efficiency for the test).

<sup>5</sup> For these tests, the 23-mm tag efficiency was assumed to be 100 percent because the operators tested the 12-mm tags first, and they were found to have an efficiency of 100 percent.

For the purpose of responding to FERC's November 13, 2015 letter, YCWA considered an antenna array to be "impaired" for the PIT-tag size if the overall efficiency test was less than 80 percent for that sized PIT-tag. This criterion is also consistent with Cal Fish and Wildlife's January 30, 2014 letter, which states "*Due to these reduced detection efficiencies (range of 20% to 80%) for 12 mm tags, the Department requests that all time periods with detection efficiencies of less than 80% for 12 mm tags in which water levels*

*were above the bottom array at the Camptonville Diversion Tunnel array be excluded for the purposes of calculating entrainment.”*

As shown in Table 5, this occurred twice (i.e., on the December 18, 2012 test for both the 23-mm and 12-mm tag) for the Lohman Ridge Diversion Tunnel antenna array, and seven times (i.e., once for the 23-mm tag and six times for the 12-mm tag) for the Camptonville Diversion Tunnel antenna array. In those cases and since YCWA could not determine when the efficiency dropped below 80 percent, the periods before and after the test was considered “in question.” For instance, the December 28, 2012 and January 11, 2013, the 23-mm PIT tag tests at Camptonville Diversion Tunnel each had an overall efficiency of 100 percent. However, the February 8, 2013 efficiency test was 67 percent. Therefore, the period in question was from December 29, 2012 through January 10, 2013 (i.e., assumed the 100% efficiency test on December 28 and January 11 were good for that entire day). Unless the period in question, or a portion of it, had been removed due to non-existent data, YCWA examined each of these periods to determine if some data during the period in question were not impaired. The results of these examinations are below.

#### 1.2.2.1 Impaired Periods - Lohman Ridge Diversion Tunnel Antenna Array

##### December 5<sup>7</sup> through 17 and 19 through 27, 2012 for both 23-mm and 12-mm PIT Tags

On December 5, 2012, YCWA found that the top panel reader (i.e., the software that records PIT-tag detections) was not functioning properly. A replacement top panel reader was installed on December 11, 2012, but failed after only a few hrs. A second top panel replacement reader was installed on December 20, 2012 and operated properly for the remaining duration of the study. The malfunctioning top panel reader caused the December 18, 2012 efficiency test of less than 80 percent for the middle panel for 12-mm PIT tags. Further, a drop in amperage was observed on December 18, 2012 for the middle antenna (i.e., the amperage for the middle panel was 1.1 amps on December 18, 2012 as compared to an average of 1.4 amps from October 5 through December 5, 2012). The drop in amperage most notably affected the 12-mm PIT-tag detection resulting in an efficiency of 10 percent for the 12-mm tag. The larger, 23-mm PIT-tag was still able to be detected reliably by the bottom and middle antennae during this period due to the increased read range of the 23-mm tag as compared to the smaller 12-mm PIT-tag. Therefore, the initial period of potential impaired detections was December 5 through 27, 2012 (i.e., 540 hrs). However, all of December 18, and portions of December 11, 13 and 20 were previously removed due to non-existent data detections (Tables 3 and 2, respectively). The remaining period (i.e., 505.8 hrs) was examined to determine if any of the data in the period in question were reliable.

For 23-mm tags, YCWA assumed any portions of the period when flow in the tunnel was

---

<sup>7</sup> This period overlapped with the period (December 2 through 11, 2012) discussed in section 1.2.1. As agreed to with the Forest Service and Cal Fish and Wildlife, YCWA reinstated the 240 hours and 7 fish detections of that period. However, part of that period remained questionable and was re-examined as part of this period of impairment. 73 hours and two fish detections for 23-mm tags and 160 hours and 3 fish detections for 12-mm tags that were previously reinstated, were removed. The final entrainment rate, with the full 240 hours and seven fish detections reinstated was 0.17 fish per day for 23-mm tagged fish and 0.3 fish per day for 12-mm tagged fish for a total of 0.20 fish per day for the Lohman Ridge Diversion Tunnel.

less than 546 cfs (i.e., when only the bottom and middle panels were wetted), the data would not be considered impaired because the two lower panels had efficiencies of 100 percent during the period. In contrast, any portions of the period when flow in the tunnel was greater than 546 cfs (i.e., when the top panel began to be wetted), the data would be considered impaired for 23-mm PIT-tags because the reader was not working properly. For 23-mm PIT-tags, during the 505.8-hr period in question, flow exceeded 546 cfs for 125 hrs. These hours were removed from the Total Study Period for 23-mm PIT-tags, and the other 380.8 hrs in the period in question were considered reliable. During the 125 hrs removed, two 23-mm PIT-tagged fish were detected during the hours removed.

For 12-mm PIT-tags, YCWA assumed any portions of the period when flow in the tunnel was less than 310 cfs (i.e., when only the bottom panel was wetted), the data would not be considered impaired because the bottom panels had an efficiency during the period of between 80 and 100 percent. In contrast, any portions of the period when flow in the tunnel was greater than 310 cfs (i.e., when the middle or top panels were wetted), the data would be considered impaired because the reader was not working properly. For 12-mm PIT-tags, during the 505.8-hr period in question, flow exceeded 310 cfs for 333 hrs. These hours were removed from the Total Study Period for 12-mm PIT-tags, and the other 172.8 hrs in the period in question were considered reliable. During the 333 hrs removed, three 12-mm PIT-tagged fish were detected and removed as part of the unreliable data.

This analysis resulted in removal of 125 hrs for 23-mm PIT-tags and 333 hrs for 12-mm PIT-tags from the Total Study Period at the Lohman Ridge Diversion Tunnel antenna array (Table 5). Similarly, two detections of 23-mm PIT-tagged fish and three detections of 12-mm PIT-tagged fish were removed from the Total Study Period at the Lohman Ridge antenna array.

**Table 5. Period, duration and tunnel flows during the Total Study Period when the PIT-tag detections by the Lohman Ridge Diversion Tunnel or the Camptonville Diversion Tunnel PIT-tag antenna array were impaired based on efficiency tests.**

### 1.2.2.2 Potentially Impaired Periods - Camptonville Diversion Tunnel Antenna Array

#### December 28, 2012 through January 8, 2013 for 23-mm PIT Tags

On December 28, 2012, the bottom and middle panels had detection efficiencies for 23-mm PIT-tags of 100 percent. On January 8, 2013, the bottom and middle panels had detection efficiencies for 23-mm tags of 50 percent. The antennas were re-tuned that day and efficiency was re-tested and found to be 100 percent for 23 mm tags for all three panels. Since YCWA can not determine when the efficiency fell below 80 percent for 23-mm tags, the entire period from December 29, 2012 through January 8, 2013 for 23-mm PIT-tags was evaluated for removal from the Total Study Period. However, two days (December 31, 2012 and January 8, 2013) were previously removed as periods when tag detection was non-existent (Table 2 and 3, respectively). The remaining 216 hrs of the period were removed from the Total Study Period for 23-mm tags. No 23-mm PIT-tagged fish were detected during this period.

#### December 18, 2012 through June 28, 2013 for the 12-mm PIT Tags

YCWA experienced a chronic problem with 12-mm tag efficiency in the middle panel. Repeated attempts were made to remedy the panel's poor efficiency for detecting 12-mm tags, often with little success or with decreased performance of the top and bottom panels. For example, a review of amperage values for the panels shows three distinct re-tuning regimes. The first from October 22 through January 11 coincides with high detection efficiencies at the beginning of the study. The second was a reduction in amperage across the entire array, with a distinct drop in the middle panel, reflecting the choice to favor the detection efficiency of the bottom antenna. The third regime was the result of an attempt to increase efficiencies at the end of the study for the beginning of the new water year.

As a result, rather than compromise the efficiency of the bottom panel, which was normally wetted, the entire array was re-tuned to maximize the performance and detection efficiency of the bottom panel. Since during the period in question the bottom panel normally functioned efficiently for 12-mm tags, YCWA examined the period in question to determine if flows in the tunnel during the period were higher than the top of the bottom panel (i.e., no portion of the middle panel would be wetted unless flow in the tunnel was greater than 346 cfs). Therefore, the initial period of potential impaired detections was December 19, 2012 through June 29 (i.e. 4,533 hrs). However, December 31, all of January 8 through 25, and portions of December 18, 28, February 3, and April 4 have been removed due to non-existent data detections (Tables 3 and 2, respectively). The remaining period (i.e., 4,073.2 hrs) was considered in question and examined to determine if some of the data collected in the period were reliable. YCWA found that diversions were above the top of the bottom antenna (i.e., greater than 346 cfs) for 832 hrs. These 832 hrs were removed from the Total Study Period for 12-mm PIT-tags, and the other 3,269.2 hrs in the period in question were considered reliable. During the 832 hrs removed, three 12-mm PIT-tagged fish were detected and these detections were removed from the Total Study Period.

As a summary, this analysis resulted in, due to impairment, removal of 216 hrs for 23-mm tags and 832 hrs for 12-mm tags from the Total Study Period at the Camptonville Diversion Tunnel antenna array (Table 5). Similarly, three detections of fish tagged with a 12-mm tag were removed from the Total Study Period at the Camptonville Diversion Tunnel antenna array.

### 1.3 Re-calculated Rates

#### 1.3.1 Lohman Ridge Diversion Tunnel

Of the 9,064 hrs in the Total Study Period, water was not diverted through the Lohman Ridge Diversion Tunnel due to low flows in the Middle Yuba River for 2,881 hrs, or approximately 32 percent of the Total Study Period (Table 1). During the 6,183 hrs when water was diverted through the tunnel, the PIT-tag detections by the antenna array was non-existent for 25.2 hrs, or less than 1 percent of the time (Tables 2 and 3). Subtracting from the Total Study Period of 9,064 hrs the periods when the antenna array PIT-tag detections were non-existent, results in an Adjusted Study Period of 6,157.5 hrs (Table 6).

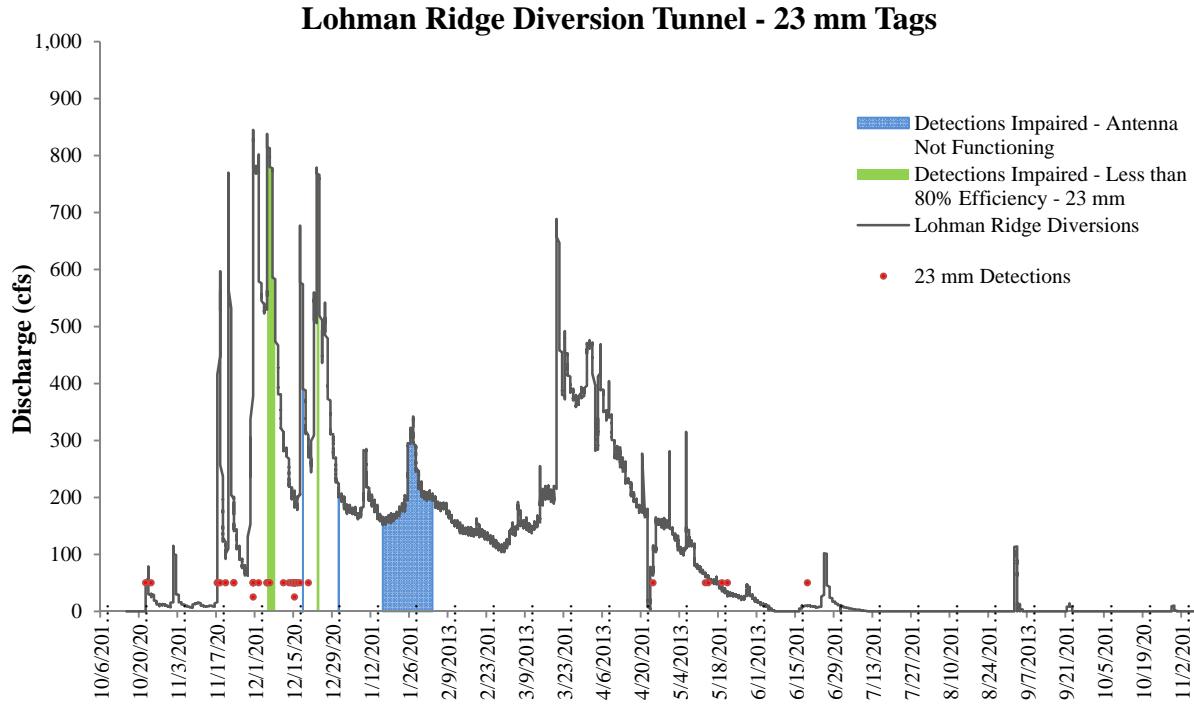

**Table 6. Lohman Ridge Diversion Tunnel entrainment rate based on hours of operation of the PIT-tag antenna array adjusted for periods of non-existing or impaired PIT-tag detection and fish detected.**

Study Period	Lohman Ridge Diversion Tunnel			
	Hours		Detected Fish	
	23-mm	12-mm	23-mm	12-mm
Total Study Period	9,064		40	8
Pit-Tag Detection Non-Existent				
Water Not Diverted Through Tunnel	-2,881		0	
Antenna Array Removed for Maintenance During Diversions	-25.5		0	
<i>Adjusted Study Period for Periods When Pit-Tag Detection was Non-Existent</i>	6,157.5		0	0
Pit Tag Detection Impaired				
Antenna Array in Tunnel, But Not Functioning	-504		-0	-0
Lees Than 80% Overall Array Efficiency	-125	-333	-2	-3
<i>Adjusted Study Period for Periods When Pit-Tag Detection was Non-Existent And Periods When Pit-Tag Detection Was Impaired</i>	5,528.5 (230.4 days)	5,320.5 (221.7 days)	38	5
<b>Entrainment Rate (fish/day)</b>	<b>0.16</b>	<b>0.02</b>		<b>43</b>
<b>Total Entrainment Rate (fish/day)</b>				<b>0.18</b>

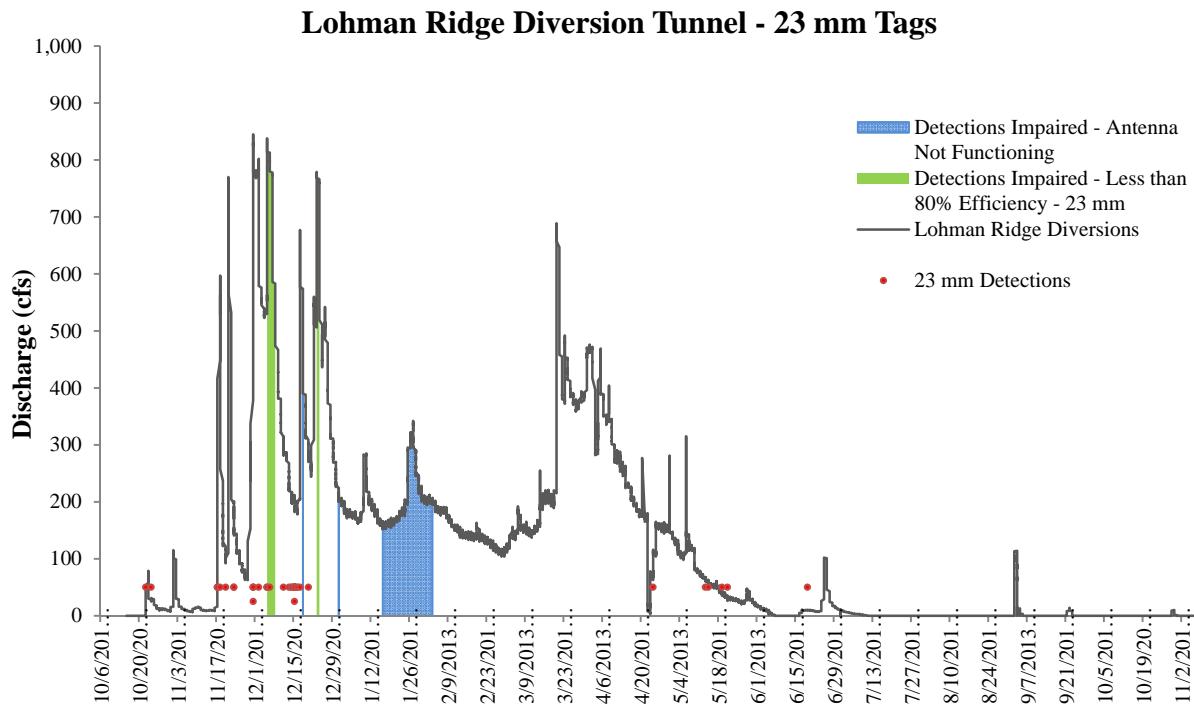

Detection of 23-mm PIT-tags was impaired for a total of 629 hrs at the Lohman Ridge Diversion Tunnel antenna array, resulting in an Adjusted Study Period of 5,528.5 hrs, or 230.4 days, for 23-mm PIT-tags. PIT tag detection of 12-mm PIT-tags was impaired for a total of 837 hrs, resulting in an Adjusted Study Period of 5,320.5 hrs, or 221.7 days, for 12-mm PIT-tags. (Table 6.)

The Lohman Ridge Diversion Tunnel has a maximum capacity of 860 cfs. Two of the peak flows from winter storm events were removed from the Total Study Period because antenna array detections were either non-existent or impaired (Figures 2 and 3). However, the peak flow event (i.e., 845 cfs) of the Total Study Period was monitored on November 30, 2012 at an estimated overall efficiency of 100 percent and was not removed.

Additionally, four other peak flows of over 600 cfs remained in the Adjusted Total Study Period.

**Figure 2.** Summary of 23-mm PIT-tag detections and tunnel flow at Lohman Ridge Diversion Tunnel with periods of impaired detections due to a non-functioning antenna (blue shading) and impaired detections due to reduced efficiency (green shading). Periods of non-existent detections resulting from removal of the antenna for tunnel for maintenance were too brief to be visible in this figure. Table 2 includes the dates and durations for those events.

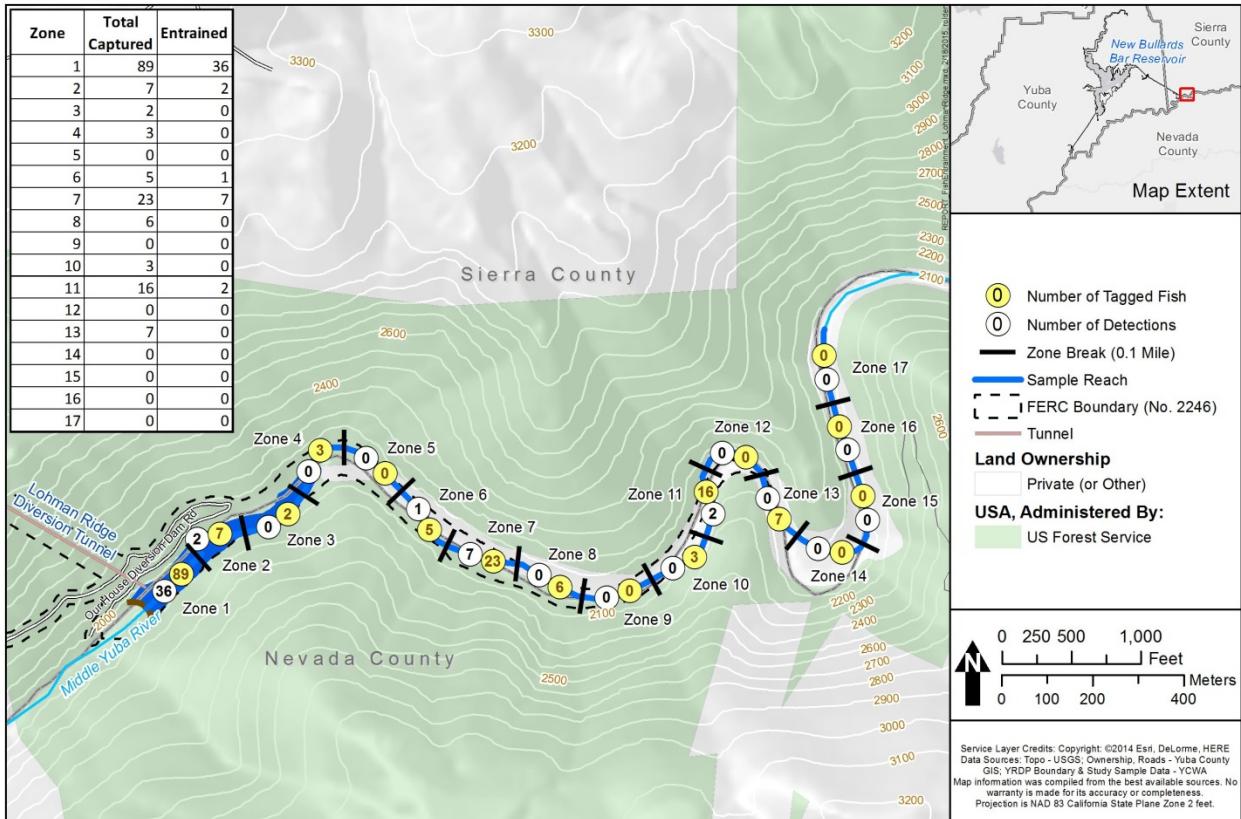

**Figure 3. Summary of 12-mm PIT-tag detections and tunnel flow at Lohman Ridge Diversion Tunnel with periods of impaired detections due to a non-functioning antenna (blue shading) and impaired detections due to reduced efficiency (green shading). Periods of non-existent detections resulting from removal of the antenna for tunnel for maintenance were too brief to be visible in this figure. Table 2 includes the dates and durations for those events.**

During the Total Study Period, 40 fish implanted with 23-mm PIT-tags were detected at the Lohman Ridge Diversion Tunnel antenna array. Five of the 23-mm PIT-tagged fish were removed from analysis because they were detected during impaired periods. Therefore, during the Adjusted Study Period, thirty-five 23-mm PIT-tagged fish were detected. The entrainment rate for 23-mm PIT-tagged fish during the Adjusted Study Period was 0.16 fish per day. (Table 6.)

During the Total Study Period, eight fish implanted with 12-mm PIT-tags were detected at the Lohman Ridge Diversion Tunnel antenna array. Three of the 12-mm PIT-tagged fish were detected during the impaired period, and were removed from the analysis. Therefore, during the Adjusted Study Period, five 12-mm PIT-tagged fish were detected. The entrainment rate for 12-mm PIT-tagged fish during the Adjusted Study Period was 0.02 fish per day. (Table 6.)

Adding the entrainment rate of 0.16 fish per day for 23-mm tagged fish and 0.02 fish per day for 12-mm tagged fish yields a total entrainment rate of PIT-tagged fish of 0.18 fish per day (Table 6).

Figure 4 shows that about 75 percent of the 48 PIT-tagged fish (i.e., the 40 in the Adjusted Study Period and the eight that were removed from the Adjusted Study Period) detected in the Total Study Period were fish that were tagged and released within 0.1 mile of the Lohman Ridge Diversion Tunnel intake.

**Figure 4. Location where YCWA tagged and released fish in the Middle Yuba River and which of those tagged fish were detected in the Lohman Ridge Diversion Tunnel during the Total Study Period.**

Of the approximately 223 days in the Adjusted Study Period for 23-mm tagged fish, no fish were detected on 202 days (i.e., 90.5% of the days in the Adjusted Study Period). Ten fish were entrained on December 15, 2012, a minimum of 2 fish per day were entrained on November 17, 23, 30, December 5, 14, and 16, 2012.

Similarly, no 12-mm PIT-tagged fish were entrained in 213 days (i.e., 97.7% of the days) out of the approximately 218 days in the Adjusted Study Periods for 12-mm PIT-tagged fish. Each of the five 12-mm PIT-tagged fish detected was recorded on separate days.

Removal of the periods during which PIT-tag detection was either non-existent or impaired had no effect on the Lohman Ridge Diversion Tunnel entrainment rate for tagged fish reported in YCWA's FLA. Table 3.3.3-29 of the FLA reported a rate of PIT-tagged fish entrainment at the Lohman Ridge Diversion Tunnel of 0.18 fish per day, and the re-

calculated entrainment rate in this letter for 23-mm and 12-mm PIT-tagged fish is 0.18 fish per day (Table 6).

### 1.3.2 Camptonville Diversion Tunnel

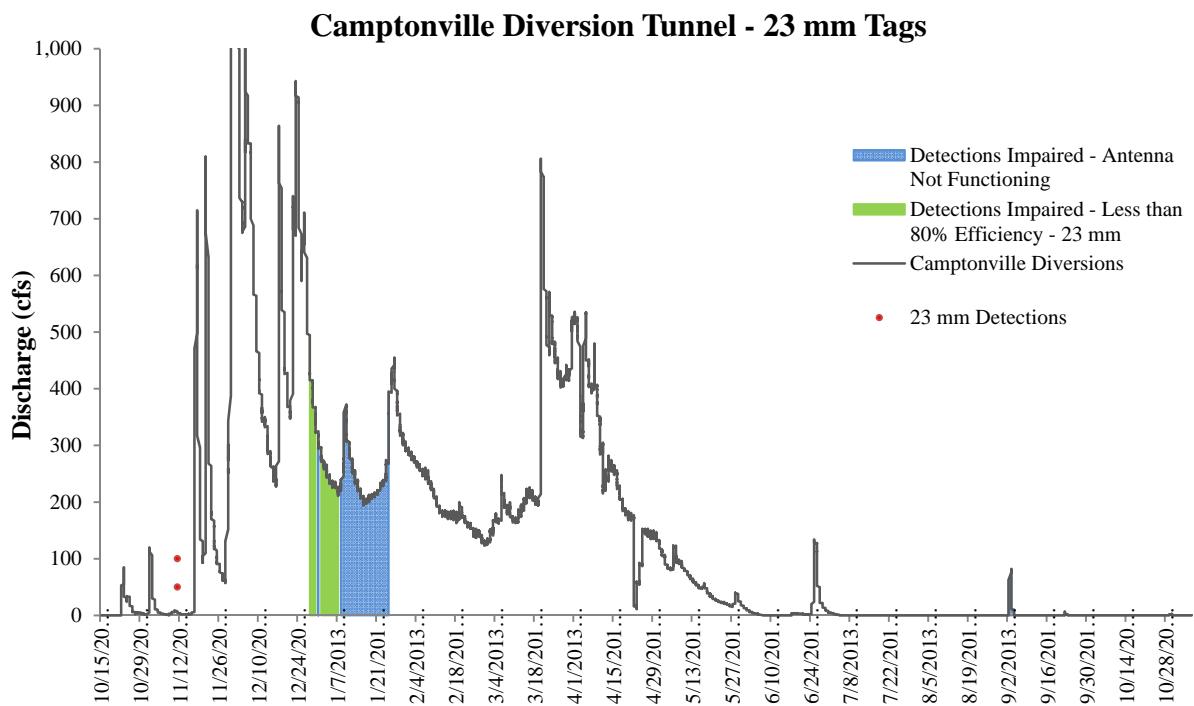

Of the 9,064 hrs in the Total Study Period, water was not diverted through the Camptonville Diversion Tunnel due to low flows in Oregon Creek for 3,160 hrs, or approximately 35 percent of the Total Study Period (Table 1). During the 5,904 hrs when water was diverted through the tunnel, the PIT-tag detection was non-existent for 75.2 hrs, or less than 1 percent of the time (Tables 2 and 3). Subtracting from the Total Study Period of 9,064 hrs the periods when the PIT-tag detection was non-existent results in an Adjusted Study Period of 5,828.8 hrs (Table 7).

**Table 7. Camptonville Diversion Tunnel entrainment rate based on hours of operation of the PIT arrays adjusted for periods of non-existing or impaired PIT detection and fish detected.**

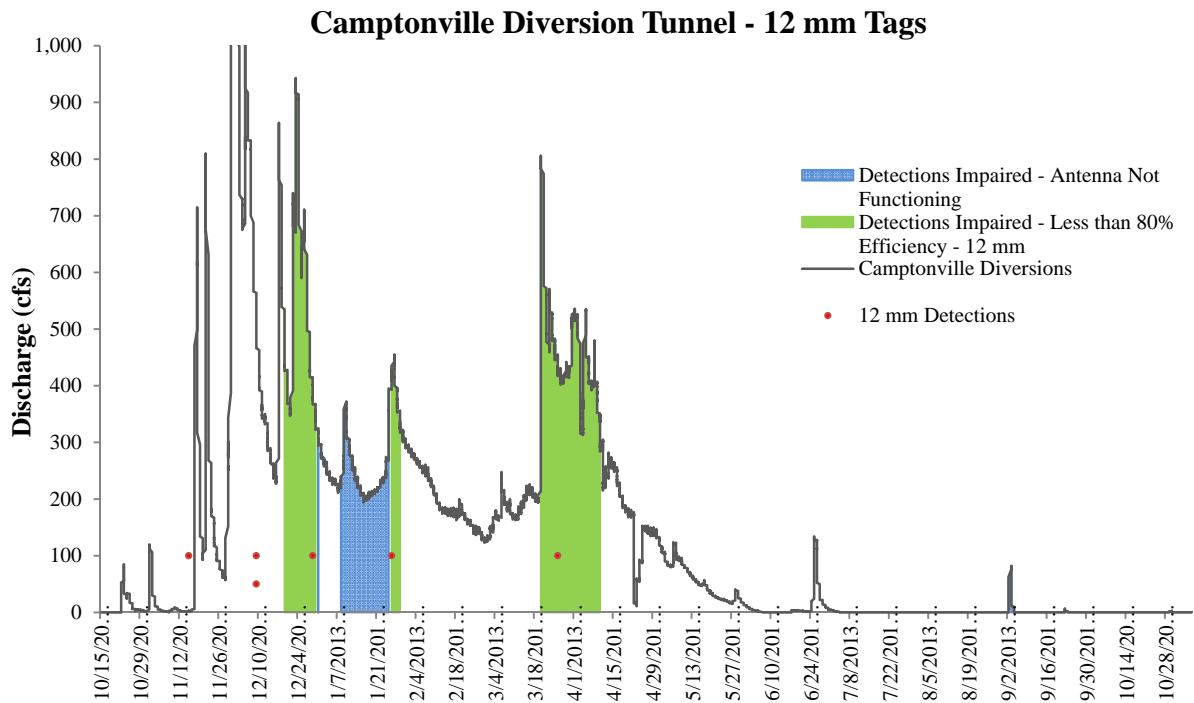

Study Period	Lohman Ridge Diversion Tunnel			
	Hours		Detected Fish	
	23-mm	12-mm	23-mm	12-mm
Total Study Period	9,064		2	6
Pit-Tag Detection Non-Existent				
Water Not Diverted Through Tunnel	-3,160		0	
Antenna Array Removed for Maintenance During Diversions	-75.2		0	
<i>Adjusted Total Study Period for Periods When Pit-Tag Detection was Non-Existent</i>	<i>5,828.8</i>		--	
Pit Tag Detection Impaired				
Antenna Array in Tunnel, But Not Functioning	-456		0	0
Less Than 80% Overall Array Efficiency	-216	-832	0	-3
<i>Adjusted Total Study Period for Periods When Pit-Tag Detection was Non-Existent And Periods When Pit-Tag Detection Was Impaired</i>	<i>5,156.8 (214.9 days)</i>	<i>4,540.8 (189.2 days)</i>	2	3
<i>Entrainment Rate (fish/day)</i>	<i>0.01</i>	<i>0.02</i>		<i>5</i>
<i>Total Entrainment Rate (fish/day)</i>				<i>0.03</i>

PIT tag detection of 23-mm tags was impaired for a total of 672 hrs at the Camptonville Diversion Tunnel, resulting in an Adjusted Study Period of 5,156.8 hrs, or 214.9 days. PIT tag detection of 12-mm PIT-tags was impaired for a total of 1,288 hrs, resulting in an Adjusted Study Period of 4,540.8 hrs, or 189.2 days for 12-mm PIT-tags. (Table 7.)

Figures 5 and 6 show the periods when the PIT-tag detection was non-existent or impaired as compared to flow in the Camptonville Diversion Tunnel during the Total Study Period.

**Figure 5. Summary of 23-mm PIT-tag detections and tunnel flow at Camptonville Diversion Tunnel with periods of impaired detections due to a non-functioning antenna (blue shading) and impaired detections due to reduced efficiency (green shading). Periods of non-existent detections resulting from removal of the antenna for tunnel for maintenance were too brief to be visible in this figure. Table 2 includes the dates and durations for those events.**

**Figure 6. Summary of 23-mm PIT-tag detections and tunnel flow at Camptonville Diversion Tunnel with periods of impaired detections due to a non-functioning antenna (blue shading) and impaired detections due to reduced efficiency (green shading). Periods of non-existent detections resulting from removal of the antenna for tunnel for maintenance were too brief to be visible in this figure. Table 2 includes the dates and durations for those events.**

During the Total Study Period, two fish implanted with 23-mm PIT-tags were detected at the Camptonville Diversion Tunnel antenna array.<sup>8</sup> Neither fish was detected during the non-existent or impaired periods. Therefore, during the Adjusted Study Period, two 23-mm PIT-tagged fish were detected. The entrainment rate for 23-mm PIT-tagged fish during the Adjusted Study Period was 0.01 fish per day (Table 7).<sup>9</sup>

During the Total Study Period, six fish implanted with 12-mm PIT-tags were detected at the Camptonville Diversion Tunnel antenna array.<sup>10</sup> Three of the fish were detected during the impaired period, and were removed from the analysis. Therefore, during the Adjusted

<sup>8</sup> An additional twenty-four 23-mm tagged fish that were previously detected at the Lohman Ridge Diversion Tunnel antenna array were re-entrained at the Camptonville Diversion Tunnel antenna array. These fish have not been included in this summary as entrained into the Camptonville Diversion Tunnel since they were already counted as entrained at the Lohman Ridge Diversion Tunnel.

<sup>9</sup> When re-entrained fish are included in the calculation, the entrainment rate for 23-mm tagged fish is 0.12 PIT-tagged fish per day.

<sup>10</sup> For 12-mm tags at the Camptonville Diversion Tunnel antenna array, two fish tagged with 12-mm tags were re-entrained from the Lohman Ridge Diversion Tunnel and not included in the calculation of entrainment at the Camptonville Diversion Tunnel.

Study Period, three 12-mm PIT-tagged fish were detected. The entrainment rate for 12-mm PIT-tagged fish during the Adjusted Study Period was 0.02 fish per day. (Table 7).<sup>11</sup>

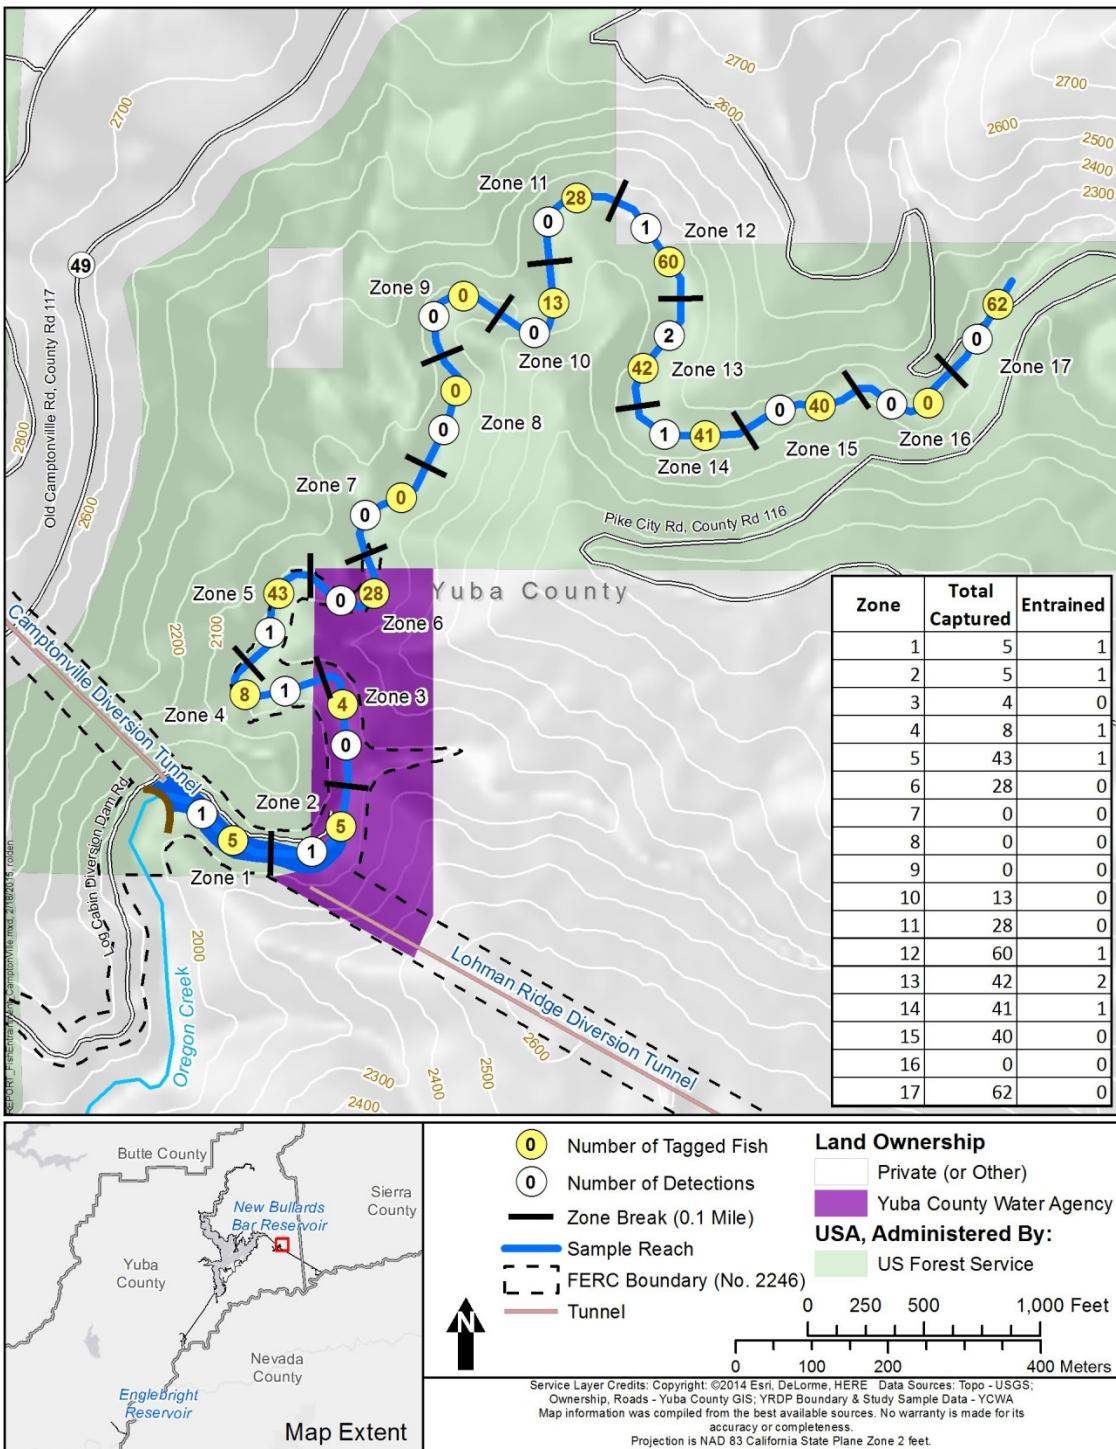

Combining the entrainment rate of 0.01 fish per day for 23-mm tagged fish and 0.02 fish per day for 12-mm tagged fish yields a total entrainment rate of tagged fish of 0.03 fish per day (Table 6).<sup>12</sup>

Figure 7 shows the location where YCWA tagged and released fish in Oregon Creek and which of those tagged fish were detected in the Camptonville Diversion Tunnel.

---

<sup>11</sup> When the two re-entrained fish are included, the entrainment rate for 12-mm tagged fish is 0.03 fish per day.

<sup>12</sup> The combined entrainment rate when re-entrained fish are included was 0.19 fish per day at the Camptonville Diversion Tunnel.

**Figure 7. Location where YCWA tagged and released fish in Oregon Creek and which of those tagged fish were detected in the Camptonville Diversion Tunnel.**

Of the approximately 215 days in the Adjusted Study Period for 23-mm tagged fish, no fish were detected on 214 days (i.e., 99.5% of the days in the Adjusted Study Period). The only two fish tagged with 23-mm tags were entrained on November 11, 2012.

Similarly, no 12-mm PIT-tagged fish were entrained in 187 days (i.e., 98.9% of the days in the Adjusted Study Period) out of the approximately 189 days in the Adjusted Study Periods for 12-mm PIT-tagged fish. One fish was detected on November 15, 2012 and two were detected on December 9, 2012.

Removal of the periods during which PIT-tag detection was either non-existent or impaired did not have a substantial effect on the Camptonville Diversion Tunnel entrainment rate reported in the YCWA's FLA. Table 3.3.3-29 in the FLA reported a PIT-tagged fish entrainment rate of 0.03 fish per day, and the re-calculated entrainment rate in this letter is 0.03 fish per day (Table 7).

### **ALTERNATIVE RE-CALCULATION OF ENTRAINMENT RATES**

YCWA met with Relicensing Participants, including the Forest Service; United States Department of the Interior, Fish and Wildlife Service; State Water Resources Control Board and Cal Fish and Wildlife, on February 24, 2015, at which time YCWA described how it planned to re-calculate entrainment rates, as required by FERC's November 13, letter. In general, the agencies concurred with YCWA's approach, but requested YCWA present in its letter an additional re-calculated entrainment rates using an alternative approach. This alternative approach was to only remove from the Total Study Period the periods when water was not being diverted through the tunnel and when the PIT-tag antenna array was removed from the tunnel for maintenance (i.e., the non-existent periods).

YCWA agreed to present this alternative in its letter to FERC, with the stipulation that YCWA believes the proper way to re-calculate entrainment consistent with FERC's direction is as YCWA has done in the letter (i.e., removing both non-existent and impaired periods).

Using the alternative approach, the Adjusted Study Period for the Lohman Ridge Diversion Tunnel antenna array is 6,158.5 hrs (Table 6), and the Adjusted Study Period for the Camptonville Diversion Tunnel antenna array is 5,828.8 hrs (Table 7). During the Adjusted Study Periods, 48 PIT-tagged fish (Table 6) were detected at the Lohman Ridge Diversion Tunnel antenna array and eight PIT-tagged fish (Table 7) were detected at the Camptonville Diversion Tunnel antenna array. Therefore, using this alternative approach, the entrainment rate of PIT-tagged fish at the Lohman Ridge Diversion Tunnel is 0.19 fish per day, and the entrainment rate of PIT-tagged fish at the Camptonville Diversion Tunnel is 0.03 fish per day.

When YCWA files an amendment to its April 28, 2014 Application for New License, it will include in the amendment the re-calculated rates of PIT-tagged fish entrainments described in this letter.

If you have any questions regarding this matter, please contact me.

Sincerely,

A handwritten signature in blue ink that reads "Curt Aikens".
